SRI TECH • CREATOR GUIDE

UPGRADE YOUR GITHUB PROFILE

A burgundy-themed guide to building an animated, memorable GitHub Profile README — with a copy-ready master prompt.

SRI SUSHMITA DASARI

CUSTOM SVG MOTION • CONTRIBUTION HEATMAP • PROJECT SHOWCASE

Make your GitHub profile feel like a personal digital identity: elegant, technically credible, and unmistakably yours.

This guide is designed for GitHub's Profile README feature. It focuses on custom SVG assets and GitHub-compatible Markdown rather than unsupported page-level CSS or JavaScript.

01 • QUICK START

Your Profile README is displayed near the top of your GitHub profile. The special repository must be public and named exactly after your GitHub username.

• **Open GitHub.com** and visit your profile.

• Check whether a public repository named exactly **YOUR-USERNAME** already exists.

• If it exists, open it and edit its **README.md**. Do not create a duplicate.

• If it does not exist, create a public repository named exactly your username and initialize it with a README.

• Clone the existing profile repository with GitHub Desktop, or open its local folder if it is already cloned.

• Use the master prompt in this guide to build the README and supporting SVG assets.

• Review the changes, commit them in GitHub Desktop, and click **Push origin** to publish.

Important: your GitHub Profile README repository is separate from your GitHub Pages portfolio repository. They can link to each other, but they serve different purposes.

02 • MAKE IT LOOK OUTSTANDING

Animated hero banner

Create a custom SVG with burgundy gradients, subtle moving light, a drawn path, technical grid details, and your name.

Burgundy visual system

Use midnight backgrounds, wine-red surfaces, rose accents, and ivory typography. Keep contrast high and layout uncluttered.

Achievements

Feature verified recognition such as Flipkart GRiD 7.0 — National Semi-Finalist and Myntra WeForShe HackerRamp 2026 — Top 100 teams, only if supported by your records.

Contribution heatmap

Use a genuine GitHub contribution graph or a clearly labelled illustration. Never present invented activity as real data.

Project showcase

Highlight a few strong projects with concise problem statements, actual technologies, and working links.

Responsive presentation

Keep the README readable on mobile. Use compact tables or simple layouts that GitHub renders reliably.

03 • COPY-READY MASTER PROMPT

Copy the prompt below into your coding assistant while your existing GitHub Profile README repository is open. Add your resume and any approved profile assets to the project folder first.

MASTER PROMPT — SRI SUSHMITA DASARI | PREMIUM GITHUB PROFILE README

```
Act as a premium digital identity designer, SVG motion artist, and senior developer-experience
engineer. Upgrade my EXISTING GitHub Profile README repository into a distinctive, animated,
burgundy-themed developer profile.

IDENTITY
Name: Sri Sushmita Dasari
Positioning: AI/ML Engineer | Full-Stack Developer | Creative Technologist
Education and achievements must be verified against my supplied resume and existing project
files. Include B.Tech in Artificial Intelligence and Machine Learning at Aditya Engineering
College and CGPA 9.10 only if verified. Feature Flipkart GRiD 7.0 — National Semi-Finalist and
Myntra WeForShe HackerRamp 2026 — Top 100 teams only if verified by supplied evidence.

FIRST: INSPECT
1. Inspect the current repository, README.md, local assets, and available resume.
2. Preserve accurate existing information and useful links.
3. Do not create a duplicate repository.
4. Do not invent awards, skills, dates, statistics, project results, or links.
5. Never display my phone number anywhere. Do not extract or reconstruct it from my resume.

ART DIRECTION
Create a premium burgundy identity:
midnight #10070C, dark wine #190B12, burgundy #451126, wine accent #701A3D, rose #C77B9B, pale
rose #E5B5C7, ivory #F8F0F3.
The result should feel cinematic, editorial, elegant, and technically sophisticated — not a
generic template or a cluttered badge wall.

CUSTOM ANIMATED SVG HERO
Create a lightweight file such as assets/sushmita-hero.svg. Include my name, role line, subtle
moving gradients, an animated SVG path, fine technical grid, restrained orbital geometry, and
a glowing underline. Use SVG gradients, paths, masks, and SMIL animation where supported. Use
unique IDs for SVG filters and gradients. Provide a polished static fallback if motion is
disabled or unsupported.

README SECTIONS
1. Animated hero banner.
2. Concise, authentic introduction.
3. Verified achievements and certifications.
4. Selected real projects with working repository or demo links.
5. Skills grouped by category using verified technologies only.
6. GitHub contribution heatmap.
7. GitHub statistics only if a reliable service is available.
8. Verified coding and professional profile links.
9. Minimal animated SVG footer.

HEATMAP AND STATISTICS
Prefer genuine GitHub contribution data and reliable services. If live data is not practical,
clearly label an illustration as decorative or demo data. Never fabricate contribution counts,
language percentages, rankings, streaks, or activity. Never expose API tokens or secrets in
public assets.

TECHNICAL COMPATIBILITY
GitHub sanitizes README HTML and does not execute arbitrary JavaScript or custom page CSS. Use
GitHub-compatible Markdown, HTML, SVG, and image embeds. Do not rely on scripts, event
handlers, custom CSS files, or iframes. Use relative asset paths where appropriate. Keep the
README readable when animations are disabled and on mobile devices.

QUALITY CONTROL
- Create the actual SVG assets and edit the real README.md.
- Validate SVG syntax and all relative paths.
- Check every link and image.
- Check all personal claims against supplied materials.
```

```
- Confirm that my phone number does not appear anywhere.
- Ensure there are no fake metrics or broken image cards.
- Keep changes local; do not commit or push automatically.
- Summarize changed files and explain how to preview and publish using GitHub Desktop.

Do not stop at a plan or code snippets. Implement the complete README and supporting assets in
the existing repository.
```

04 • PUBLISH SAFELY WITH GITHUB DESKTOP

• Review the README preview on GitHub before publishing.

• In GitHub Desktop, inspect every changed file. Confirm no private data or secrets were added.

• Enter a commit message such as **Upgrade profile README**.

• Click **Commit to main**, then **Push origin**.

• Open your GitHub profile and verify that the README and SVG assets render as expected.

Troubleshooting

Animation does not play: GitHub may sanitize or restrict some SVG animation features. Keep a good static design and test the SVG on GitHub itself.

Image is broken: verify the filename, capitalization, and relative path. For example, if the SVG is in assets/, embed it with the repository-relative path.

Stats card is unavailable: external services can fail or rate-limit. Remove broken widgets or replace them with a reliable alternative; never fabricate metrics.

README not showing on profile: ensure the repository is public and its name exactly matches your GitHub username.

Privacy checklist

• Phone number is absent from README, SVG files, metadata, and linked public content.

• Resume is reviewed before any public download link is added.

• All awards and statistics are accurate and verifiable.

• No API tokens, private contact details, or secrets are committed.

SRI TECH • CREATE WITH INTENTION. SHIP WITH CARE.

This PDF is a practical guide. GitHub's rendering behavior and third-party statistics services may change; verify the final README directly on GitHub before sharing it.
